SUSTAINABILITY SNAPSHOT

WASTE MANAGEMENT

MANAGEMENT

Building materials create a large amount of waste – around half of the solid waste and materials used in the world, according to one international study – which places a large burden on landfills. To reduce waste from demolition, we reused many existing materials in our fit-out design. Construction waste was minimised and separated on-site, according to a strict waste management plan, resulting in more than 90% of waste being diverted from landfill.
